MULTIPLE REGRESSION EXAMPLE

MULTIPLE REGRESSION EXAMPLE For a sample of $n = 166$ college students, the following variables were measured: $Y =$ height $X_1 =$ mother's height ("momheight") $X_2 =$ father's height ("dadheight") $X_3 = 1$ if male, 0 if female ("male") Our goal is to predict student's height using the mother's and father's heights, and sex, where sex is

In a multiple regression model, where the x 's are predictors and y is the response, multicollinearity occurs when: a) the x 's provide redundant information about y As a preliminary analysis, a simple linear regression model was done The fitted regression equation was: $\text{sales} = 2259 - 1418 \text{ price}$ The ANOVA F test p -value was 000, and $R^2 = 597\%$
