The graph does not have an amplitude because as the linear function increases without bound the combined function $h(x) = x + \sin x$ will increase without bound as well. The graph is bounded between the graphs of $y = x + 1$ and $y = x - 1$ because sine oscillates between -1 and 1 .

We can apply this theorem to a special case that is useful in graphing polynomial functions. If a point on the graph of a continuous function f at $x=a$ lies above the x -axis and another point at $x=b$ lies below the x -axis, there must exist a third point between $x=a$ and $x=b$ where the graph crosses the x -axis. Call this point $(c, f(c))$.
